PRACTICAL 01 / BEGINNER LAB

Check a deployed Warp Route

Name: _____ Date: _____

Aim. Inspect two testnets and verify a working route without moving tokens.

Before you start. Use existing-route after completing Windows setup and .env configuration. This exercise is read-only.

Commands

```
npm.cmd run preflight
npm.cmd run warp:check
npm.cmd run verify
Get-Content .\deployments\verification.json
```

Expected result

Both chain IDs are correct, the CLI reports no violations, both remote routers are enrolled, and locked BSC collateral equals outstanding Sepolia synthetic supply when no message is in flight. No gas is spent by these checks.

Record your observations

Origin / destination: _____
Amount or setting: _____
Dispatch hash or verification time: _____
Message ID / result: _____

Quick questions

- Which chain ID is BSC testnet? Which one is Sepolia?
- Why does an RPC balance check not prove message delivery?

Use testnets only. Run from the selected kit project folder. Use npm.cmd. Amounts are in smallest units. Never record a private key or recovery phrase on this sheet.
