PRACTICAL 03 / BEGINNER LAB

Reverse direction: Sepolia to BSC

Name: _____ Date: _____

Aim. Change the origin chain and return the token.

Before you start. Complete practical 02 first and confirm that 1 GLD arrived on Sepolia. Use the same funded signer.

Commands

```
$A = @(
  '--origin','sepolia','--destination','bsctestnet',
  '--amount','1000000000000000000','--relay'
)
npm.cmd run warp:send -- @A
# Wait for delivery, then verify.
npm.cmd run verify
```

Expected result

Sepolia burns 1 GLD and BSC releases 1 GLD. If you began with no other bridged tokens, both locked collateral and synthetic supply return to zero. If immediate self-relaying fails, use practical 08 on the existing dispatch.

Record your observations

Origin / destination: _____
Amount or setting: _____
Dispatch hash or verification time: _____
Message ID / result: _____

Quick questions

- What changed in the command compared with practical 02?
- Why must the Sepolia token balance exist before the return?

Use testnets only. Run from the selected kit project folder. Use npm.cmd. Amounts are in smallest units. Never record a private key or recovery phrase on this sheet.
