PRACTICAL 09 / BEGINNER LAB

Switch the BSC RPC endpoint

Name: _____ Date: _____

Aim. Use an alternate RPC while keeping the same contracts and chains.

Before you start. No message should be in flight. This is a read-only practical: do not deploy or send tokens.

Commands

```
notepad.exe .env
# Change this ONE setting in Notepad and save:
# BSC_TESTNET_RPC=https://bsc-testnet.drpc.org
npm.cmd run preflight
npm.cmd run warp:check
npm.cmd run verify
# Optional: restore the original URL and recheck.
```

Expected result

The alternate RPC must report chain 97. Token/router addresses and balances should agree with the original endpoint, allowing for block timing. If the endpoint is unavailable, record that result and restore the known working URL; do not switch to mainnet.

Record your observations

Origin / destination: _____
Amount or setting: _____
Dispatch hash or verification time: _____
Message ID / result: _____

Quick questions

- Does changing RPC deploy a new token?
- Why is the chain ID check necessary before using a new URL?

Use testnets only. Run from the selected kit project folder. Use npm.cmd. Amounts are in smallest units. Never record a private key or recovery phrase on this sheet.
